**Subject:** Outcome of Acetamiprid Reduced Risk Meeting  
**Date:** 05/22/2012 01:36 PM

---

Anita, everyone:

The Reduced Risk Committee granted acetamiprid reduced risk classification for all 3 proposed use patterns: asparagus, sweet corn, and mustard greens/leafy brassica.

In the voting, BEAD, HED, BPPD and RD all supported granting "Reduced Risk". Acetamiprid clearly has a better profile from the human health standpoint than all of the alternatives.

For the EFED side, acetamiprid was not clearly less risky compared to all of the alternatives, and I presented that information as captured in ERB4's analysis. However, BEAD reported that in the marketplace, acetamiprid would most likely displace the pyrethroids - and based on ERB4's evaluation, it is less risky than the pyrethroids.

Based on the above, I think the decision was appropriate.

ERB4 - thanks for your hard work on this analysis, the reduced risk document was thoughtful and thorough.

- Meredith
